1. About the app and core principles

Lexora is a desktop application (Tauri 2 + React + Rust, SQLite database) for learning foreign languages. You build a personal vocabulary, review words with the SM-2 spaced-repetition algorithm, write and translate texts with AI, practice pronunciation and talk to an AI conversation partner.

Local-first. Vocabulary, reviews and statistics work fully offline. The internet is needed only for AI features (translation, text checking, voice).

Privacy by design. No analytics or telemetry. Data is stored only on your computer; AI usage counters are local too.

Deterministic repetition. The same answers always produce the same next review date (SM-2).

No data loss. All database writes are transactional, integrity is checked at startup, and there are automatic copies and JSON export.

What is in the app

Section	Purpose
Vocabulary	Personal word list: search, status filters, adding words one by one, as a list or from a file, a word card with notes and pronunciation.
Study	Reviews with SM-2 intervals. 8 modes: flashcards, typing, listening, fill the gap, image association, irregular verbs, definitions, speaking.
Writing	Grammar / spelling / style check with explanations, rewriting in the tone you need, exercises based on your typical mistakes.
Translate	Translation of text, photos, documents and PDF, speech; live interpreter; translation history.
Speak	Phoneme-level pronunciation scoring, Shadowing, minimal pairs, history.
Dialogue	Conversation scenarios with AI (coffee shop, travel, etc.) by voice or text, with scoring of your replies.
Collections	Ready-made packs (Top 5000, phrasal and irregular verbs, Business/Academic/Travel) and your own collections.
Stats	Vocabulary growth, accuracy, streak, 30-day activity, hardest words.
Popup translator	Translate selected text in any app with a global hotkey.
Stickers	Small cards over your desktop for ambient review.
Writing check in other apps	"Grammarly-style": a badge with suggestions in a text field of any app.

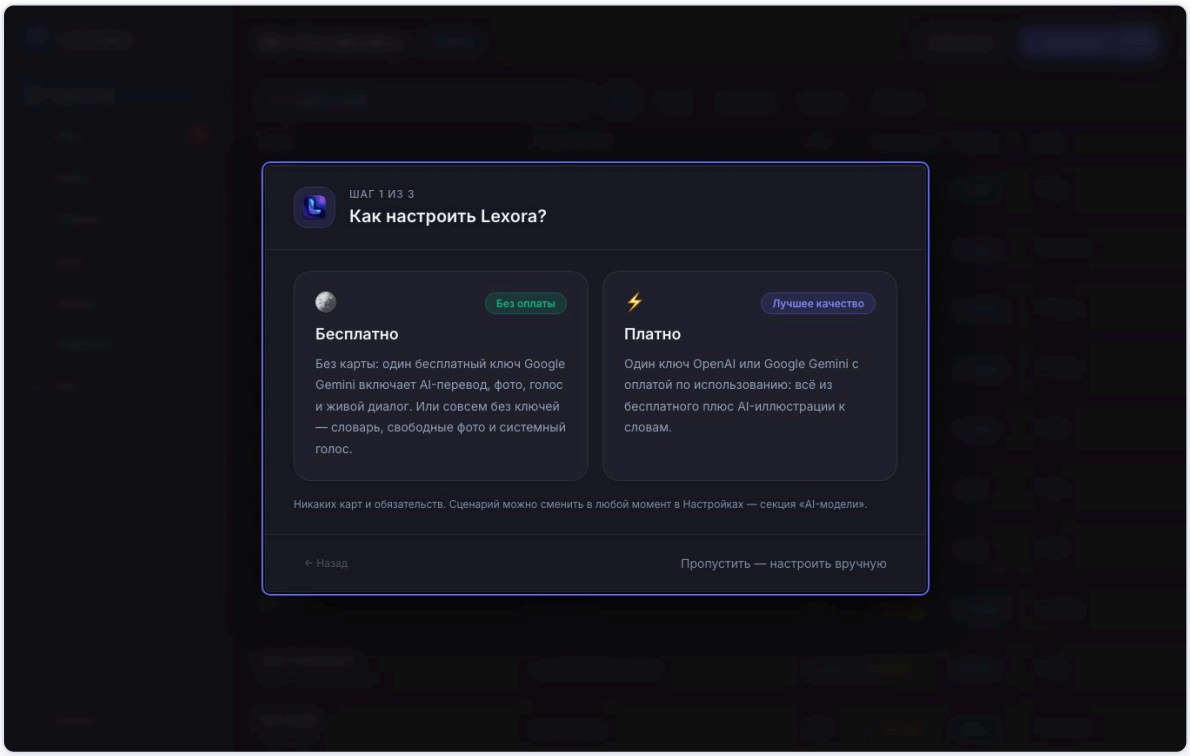

2. Installation and first launch

Installation

OS	How to install
macOS	Open `Lexora_<version>_universal.dmg` (Intel + Apple Silicon; separate aarch64 / x64 builds exist too) and drag Lexora to Applications. Until the build is notarized by Apple, Gatekeeper may refuse to open the app — run the file `Разрешить Lexora.command` from the DMG: it removes the quarantine flag.
Windows	Installer `Lexora_<version>_x64-setup.exe` (NSIS). Installs per user; no administrator rights needed.
Linux	AppImage / deb — experimental.
From source (macOS)	`npm install`, then `bash scripts/install-mac.sh` — builds and installs `Lexora.app` into Applications without a DMG. For development: `npm run tauri dev`. Requires Node.js 18+, Rust stable, Xcode Command Line Tools.

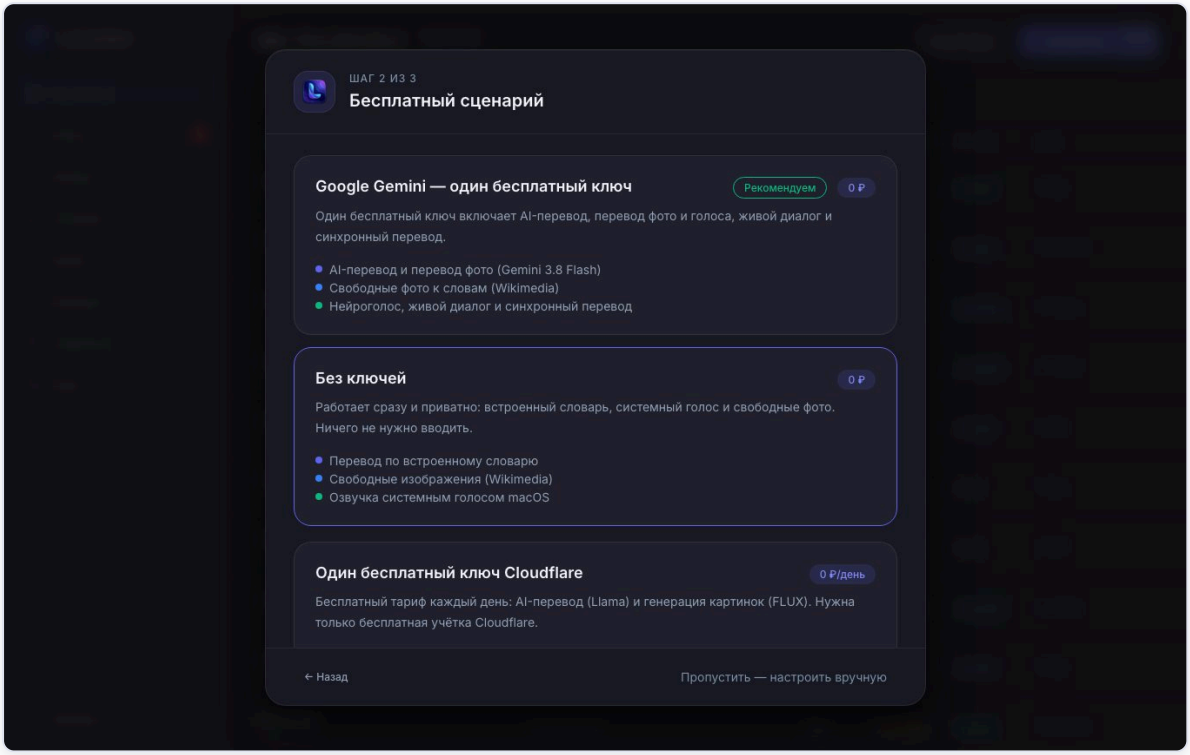

First-run wizard

On first launch, while AI is not configured, the "Как настроить Lexora?" (How to set up Lexora) wizard opens automatically. It picks a model package for you — no need to configure each role by hand. The wizard is in Russian.

Setup wizard: two scenarios — "Бесплатно" (Free) and "Платно" (Paid). The link "Пропустить — настроить вручную" (Skip — configure manually) is at the bottom.

- **Free** — no card needed. One free Google Gemini key (get it at aistudio.google.com → Get API key) enables AI translation, photo and voice translation, live dialogue and live interpreting. You can also go with no keys at all: built-in dictionary, free photos (Wikimedia) and the system voice. A free Cloudflare Workers AI option is also available.
- **Paid** — one OpenAI or Gemini key billed by usage: everything from the free scenario plus AI illustrations for words.

Step 2 ("Free scenario"): Google Gemini (recommended), "No keys" or Cloudflare. Then paste the key and confirm.

You can change the scenario later: *Settings → AI models →* "*Сменить сценарий*" *(Change scenario)*.

Operating-system permissions

Permission	Why
Accessibility (macOS)	Capturing selected text for the popup translator and running "writing check in other apps". System Settings → Privacy & Security → Accessibility → enable Lexora. Without it the hotkey opens the popup but the selected text may not be filled in. When running via `npm run tauri dev`, grant it to the binary `src-tauri/target/debug/lexora`.
Microphone	Speak, the "Speaking" study mode, Dialogue, speech recording and live interpreting.

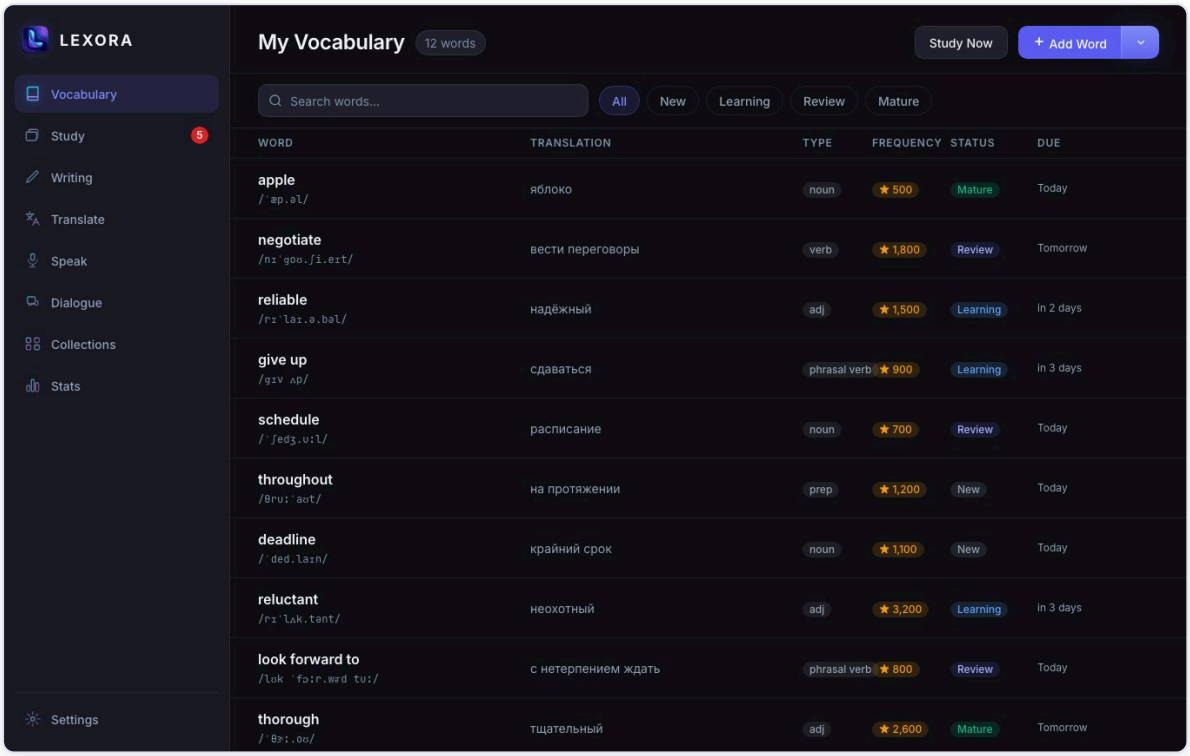

3. Quick start in 5 steps

1. **Choose an AI scenario** in the wizard (Google Gemini with a free key is recommended) and paste the key.
2. **Set your learning language and translation language**: Settings → Language Preferences.
3. **Add words**: Vocabulary → *Add Word* (one by one), *Paste list* (as a list), or load a ready-made pack in Collections.
4. **Study**: Study → choose a mode → *Start Session*. Rate yourself with Again / Hard / Good / Easy — the app schedules the next review itself.
5. **Turn on the background tools**: hotkey `⌘⇧L` to translate selected text and `⌘⇧S` for stickers (Windows/Linux: `Ctrl+Shift+L` / `Ctrl+Shift+S`).

> If you do not want to configure AI at all, the app still works: vocabulary, reviews and statistics are fully offline.

4. Interface: navigation

On the left is the sidebar with the main sections. The **Study** item has a red counter showing how many cards are due today. **Settings** is at the bottom. You can hide the window: the app stays in the system tray / menu bar.

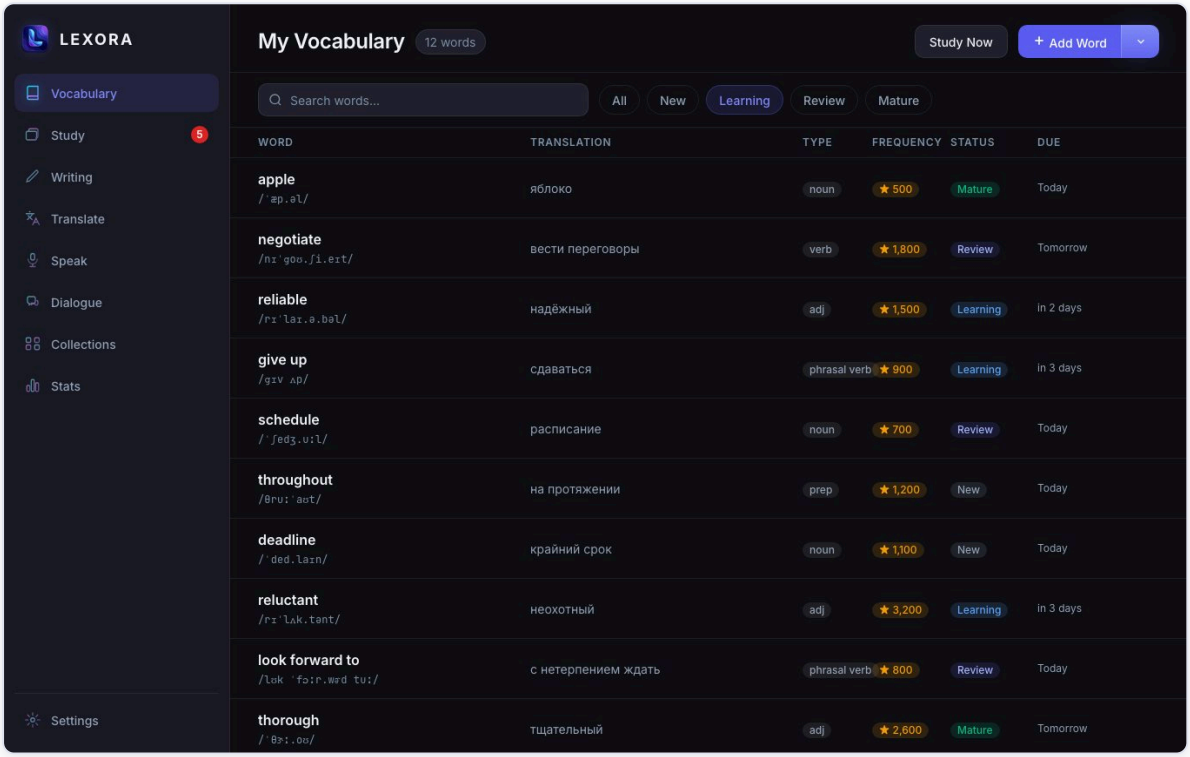

Main screen: sidebar (Vocabulary, Study, Writing, Translate, Speak, Dialogue, Collections, Stats, Settings) and section content.

The interface is dark and works with mouse and keyboard (there is a "Skip to main content" link, visible focus and ARIA labels).

5. Vocabulary — your personal word list

A table of words with columns: **Word** (word and transcription), **Translation**, **Type** (part of speech), **Frequency** (frequency rank), **Status** and **Due** (next review). The list is virtualized — large vocabularies (thousands of words) scroll smoothly.

- **Search** by word and translation — the "Search words…" box.
- **Status filters**: All · New · Learning · Review · Mature.
- **Study Now** — go straight to review.
- ▶ **sound** next to a word — text-to-speech (TTS is cached locally).

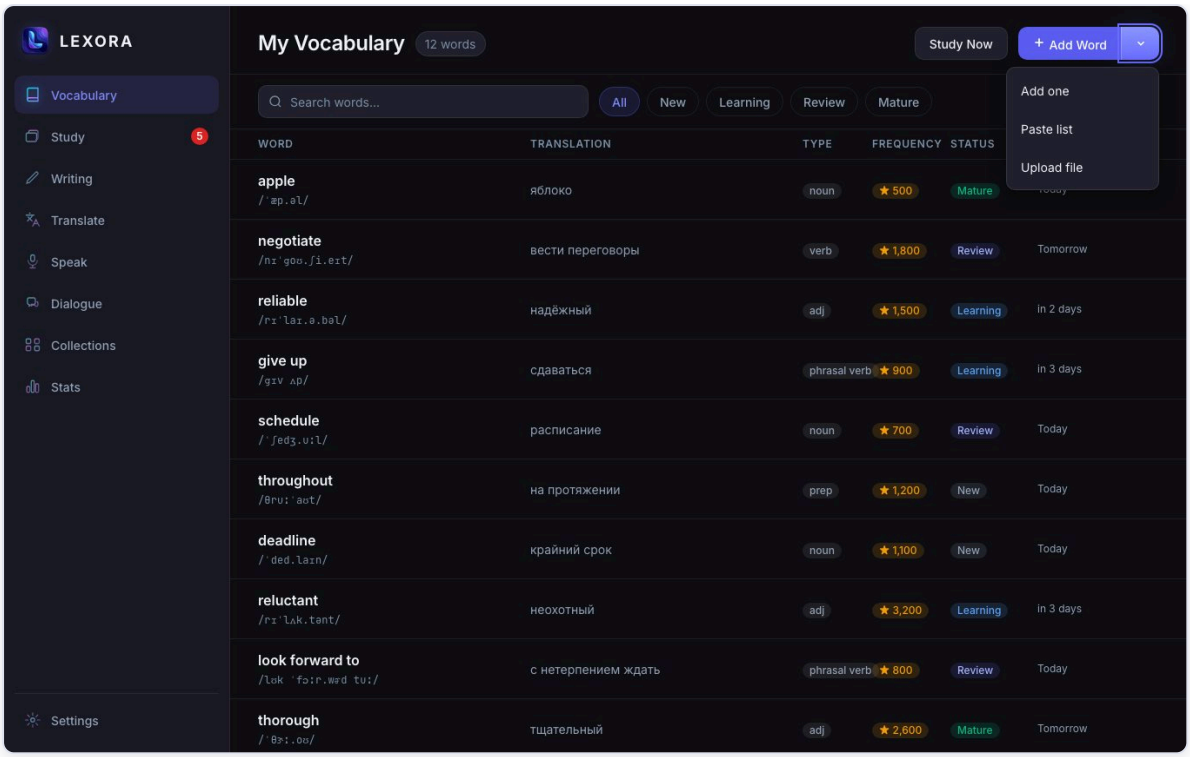

The "Learning" filter keeps only words currently being learned.

Word statuses

Status	Meaning
New	Word added, not reviewed yet.
Learning	Interval 1–4 days.
Review	Interval 4–21 days.
Mature	Interval over 21 days — the word has stuck.

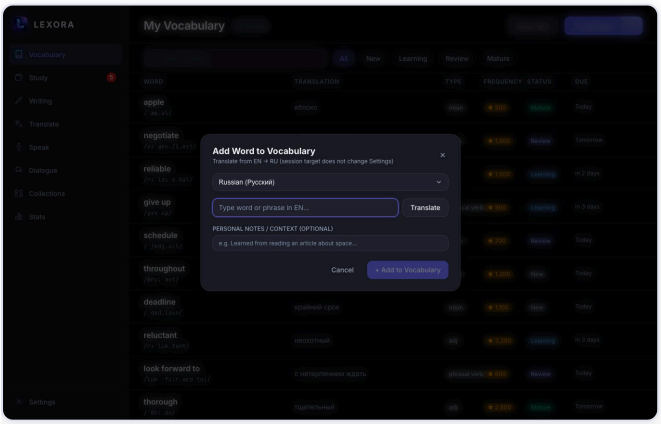

Adding words

The **Add Word** button and the arrow next to it open a menu with three ways:

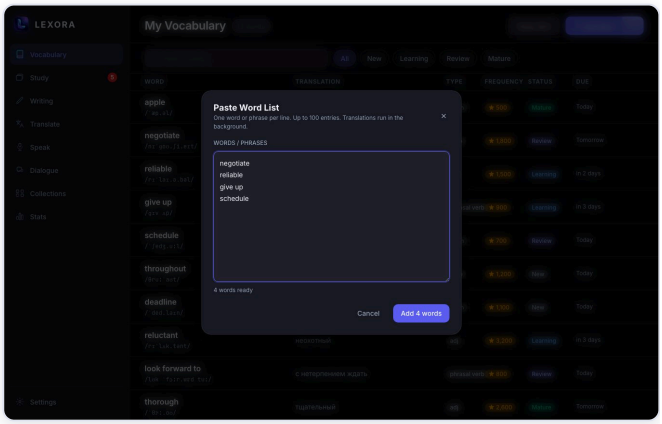

Add menu: Add one / Paste list / Upload file.

1. **Add one** — type a word or phrase and press *Translate*: Lexora finds the translation, transcription, part of speech, examples and (if enabled) a picture. The "Personal notes" field lets you write context or a mnemonic. *Add to Vocabulary* saves the word. The translation language is chosen in the window (a per-session setting; it does not change the global one).
2. **Paste list** — paste words one per line (up to 100 entries at a time). They are translated in the background.
3. **Upload file** — load a word list from a file.

"Add Word to Vocabulary" window: translation language, word field, notes.

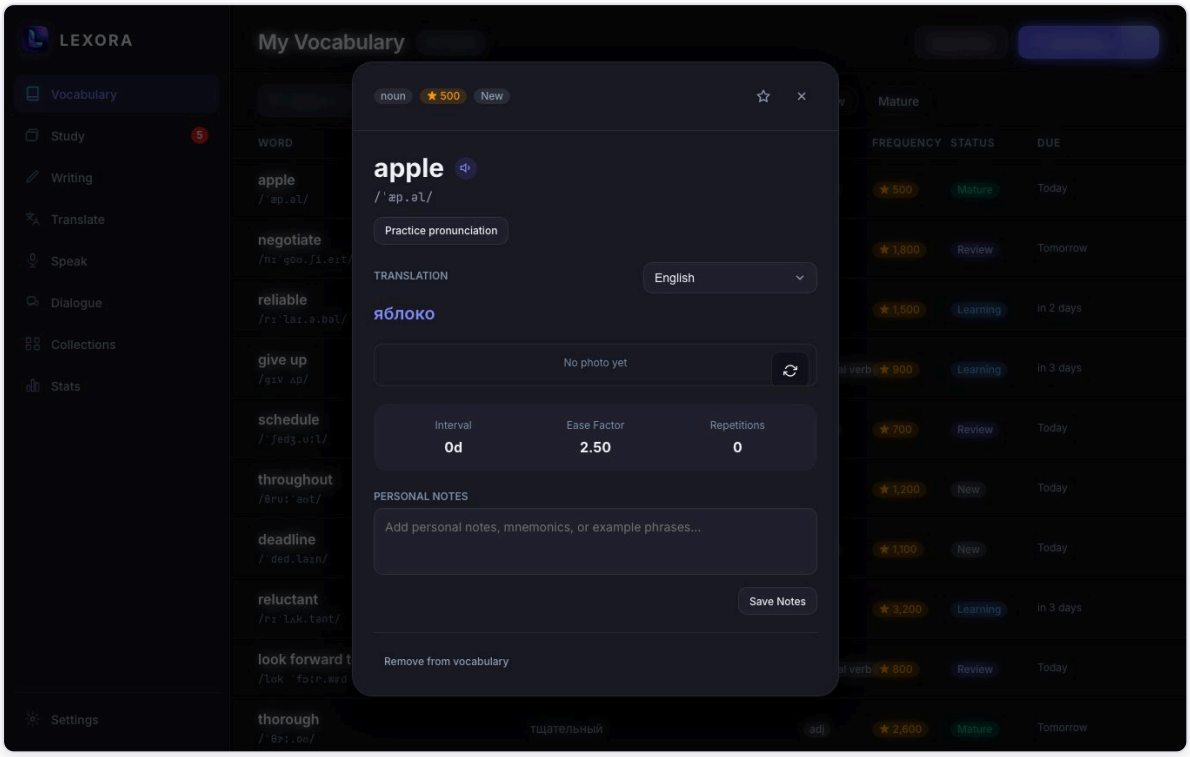

"Paste list": the "4 words ready" counter and the "Add 4 words" button.

Word card

Clicking a row opens a panel on the right: word, transcription, part of speech, frequency, status, translation and alternatives, illustration, SRS data (*Interval*, *Ease Factor*, *Repetitions*) and personal notes (*Save Notes*).

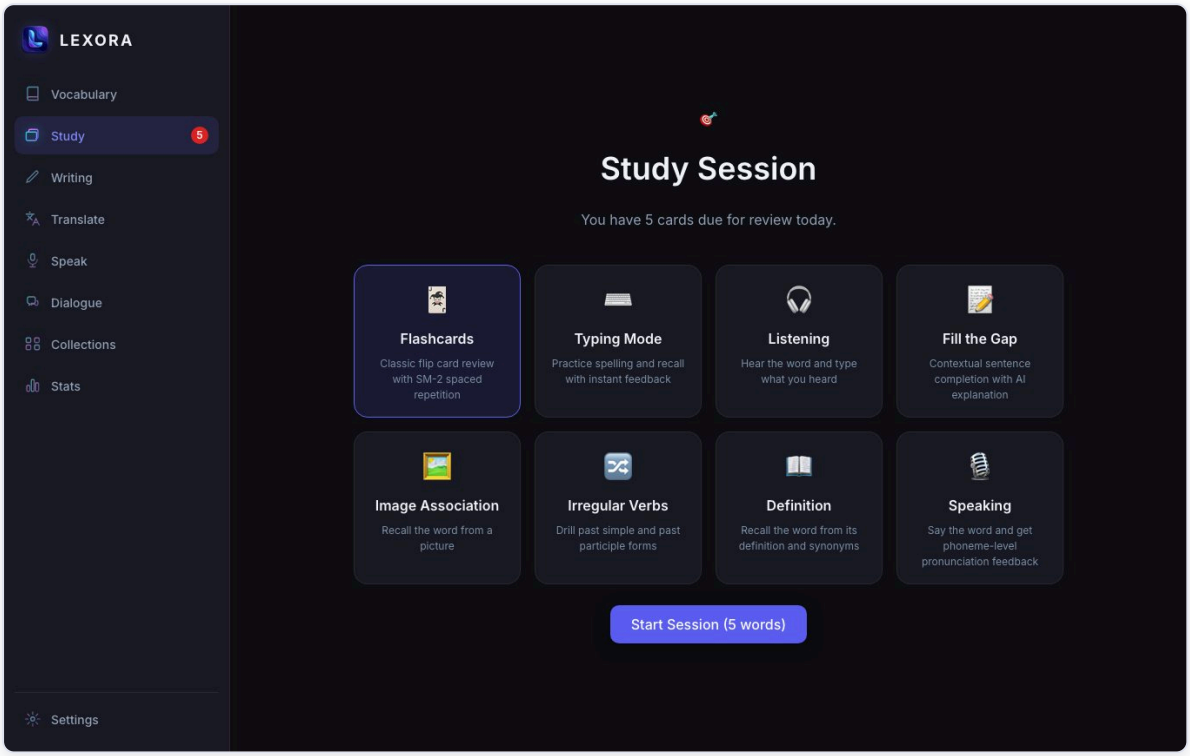

Also here: favorite (star), **Practice pronunciation** (jumps to Speak with this word), picture refresh and **Remove from vocabulary**.

Word card for "apple".

6. Study — spaced repetition (SRS)

The "Study Session" screen shows how many cards are due and offers 8 modes. Choose a mode and press **Start Session**. At the top is session progress ("Card 1 of 5"); at the bottom — "Due today", "Accuracy" and "Time".

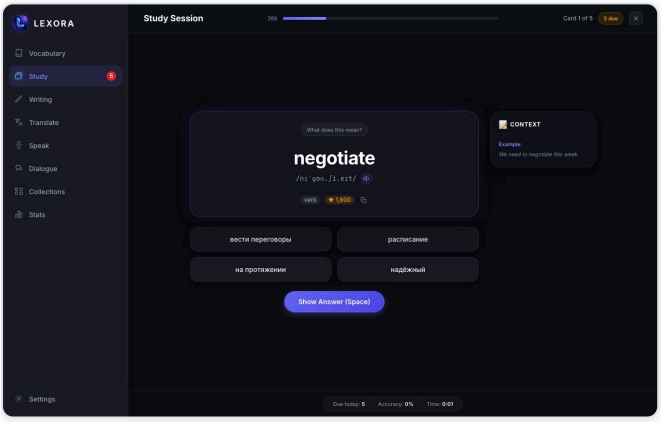

Choosing a mode and starting a session.

The algorithm

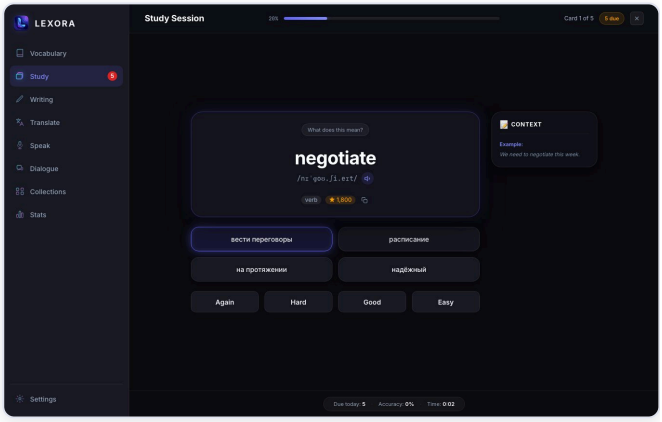

Lexora uses SM-2 — a pure, deterministic function. After each answer a grade is recorded (0 — total blackout … 4 — easy) and the interval, ease factor and next review date are recalculated. A mistake returns the word to a short interval and increases the "lapses" counter, which feeds the "hardest words" list in the statistics.

The 8 modes

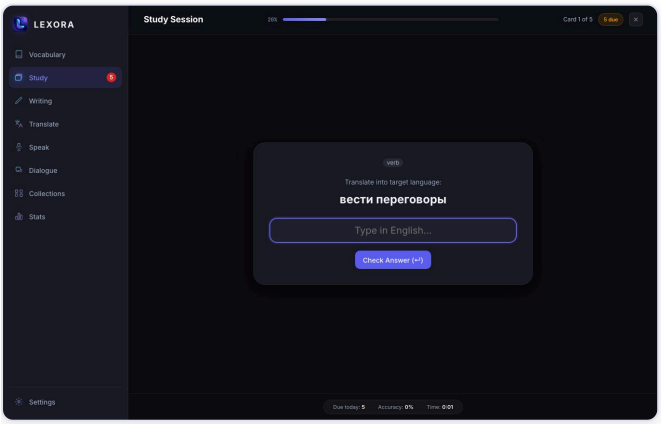

Mode	How it works
Flashcards	Classic cards: word → choose a translation from several (or "Show Answer", `Space`) → self-rating **Again / Hard / Good / Easy**. A "Context" panel on the right shows an example.
Typing Mode	You see the translation and type the word. Check with `Enter`; spelling mistakes are explained.
Listening	You hear the word and type what you heard.
Fill the Gap	A sentence with a gap; AI can explain the mistake.
Image Association	Recall the word from a picture.
Irregular Verbs	Practice Past Simple and Past Participle forms.
Definition	Definition and synonyms → recall the word.
Speaking	Say the word aloud; phoneme-level feedback.

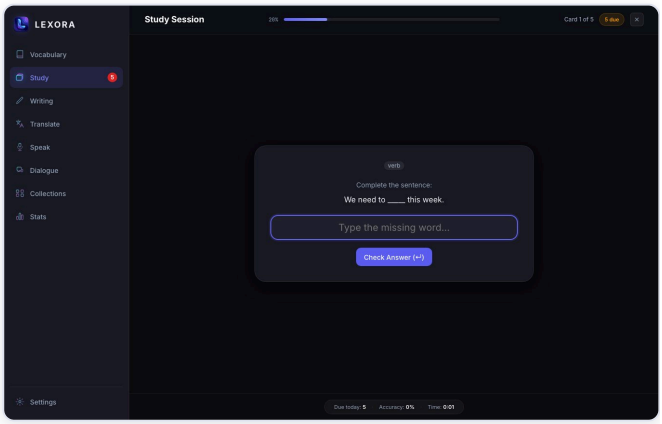

Flashcards: a question with answer options and a context panel.

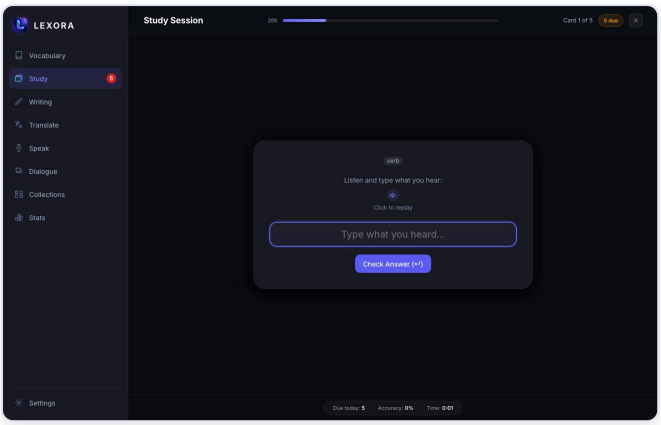

After answering — rate Again / Hard / Good / Easy.

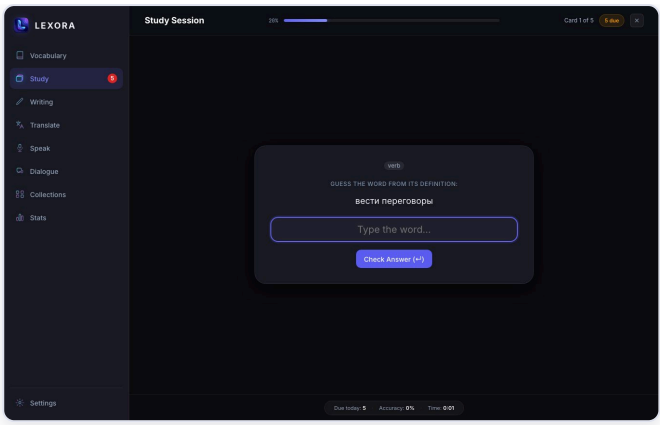

Typing Mode.

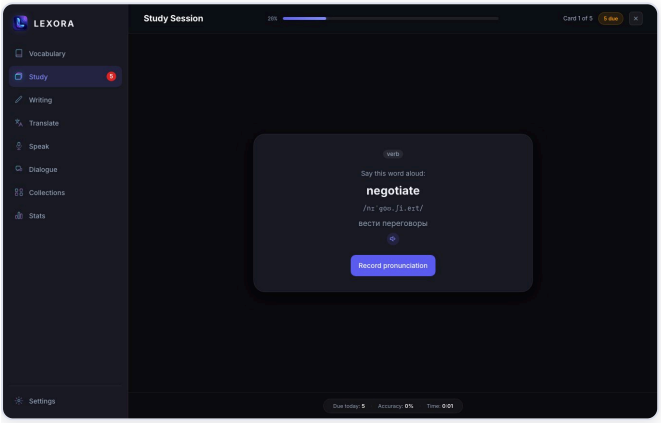

Fill the Gap.

Listening.

Definition.

Speaking: "Record pronunciation" — recording and phoneme breakdown.

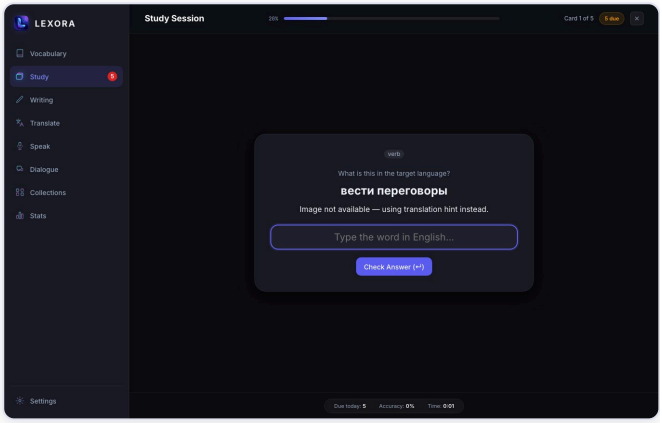

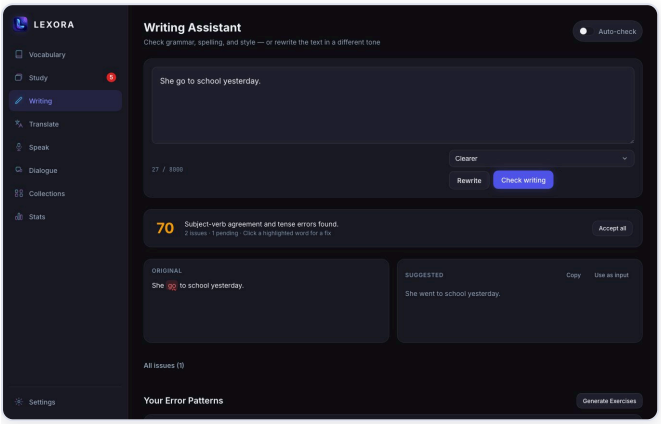

Image Association: if a word has no picture, a translation hint is shown.

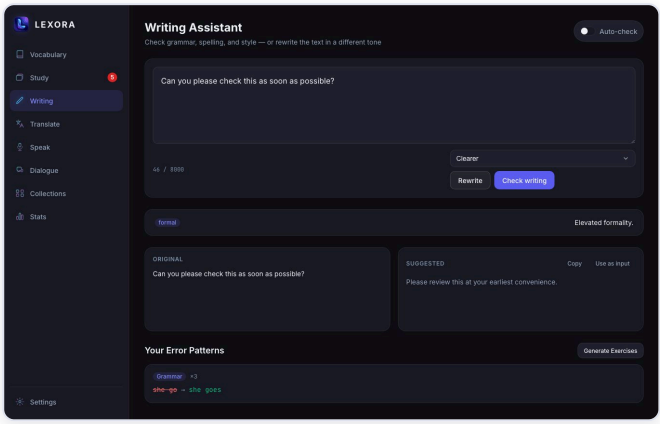

At the end of a session a summary appears; **Back to Study Overview** returns to mode selection. "Irregular Verbs" and "Image Association" work with suitable words from your vocabulary (verbs and words with pictures).

7. Writing — writing assistant

Paste a text (up to 8000 characters) and press **Check writing**. Lexora scores the text (0–100), highlights mistakes, shows a corrected version and explains each issue (category, rule).

Check result: score 70, source text with highlights, corrected version and the issue list.

Rewriting in Formal mode: original and suggested version side by side.

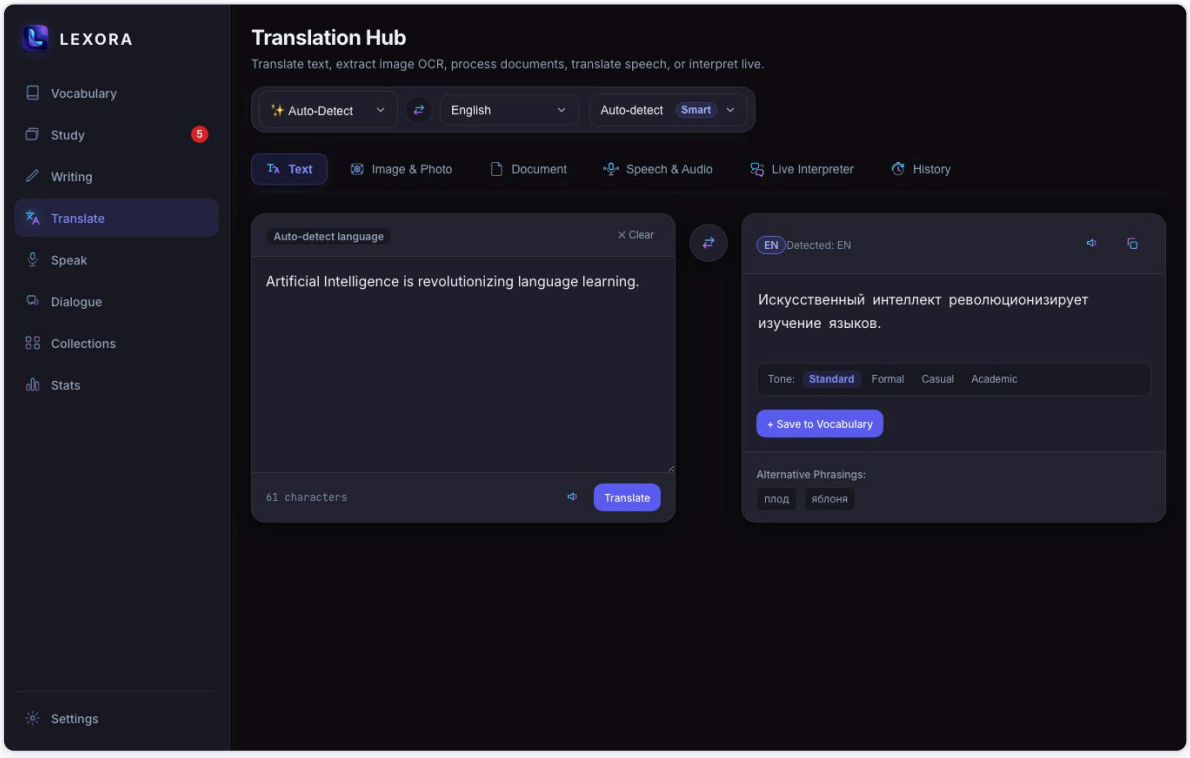

- **Apply / Accept all** — accept one fix or all. **Copy** copies the corrected text, **Use as input** puts it back as the new input.
- **Auto-check** (toggle at the top) — check automatically after you stop typing. Uses AI requests.
- **Rewrite** — rewrite the text: *Clearer, Shorter, More formal, Friendlier, Professional, Simpler*.
- **Your Error Patterns** — your typical mistakes (e.g. "she go → she goes ×3"). **Generate Exercises** builds exercises on exactly these.

> **Writing privacy mode** (Settings → Privacy) does not store checked texts and does not collect error patterns.

8. Translate — translation hub

At the top: source language (Auto-Detect by default), the ⇄ swap button, target language and the "Smart" mode. Six tabs:

Tab	What it does
Text	Text translation. Tone: Standard / Formal / Casual / Academic. Source and translation playback, copy, **Save to Vocabulary** (save as a word/card), alternative phrasings.
Image & Photo	Translate pictures and screenshots: drag a file (PNG, JPG, WebP), choose via a dialog or paste from the clipboard with `⌘V`. View modes: In-Place Overlay (translation over the image), Side-by-Side, Extracted Text.
Document	Documents and PDF: `.pdf .docx .md .txt .srt .vtt`. Two-pane "original / translation" editor, term glossary, tone. The result can be downloaded.
Speech & Audio	Record from the microphone (Record) or upload an audio file (File Upload): speech recognition and translation; phrases can be added to the vocabulary.
Live Interpreter	Simultaneous interpreting: speak in any language — the translation is spoken back. Option "Speak the translation aloud". A session lasts up to 15 minutes and the transcript is saved to History. Requires a provider with live voice (Gemini).
History	Translation history with filters All / Text / Image / Document / Audio, favorites, copy, delete entry and "Clear History".

Text: source on the left, translation on the right with tone selection and alternatives.

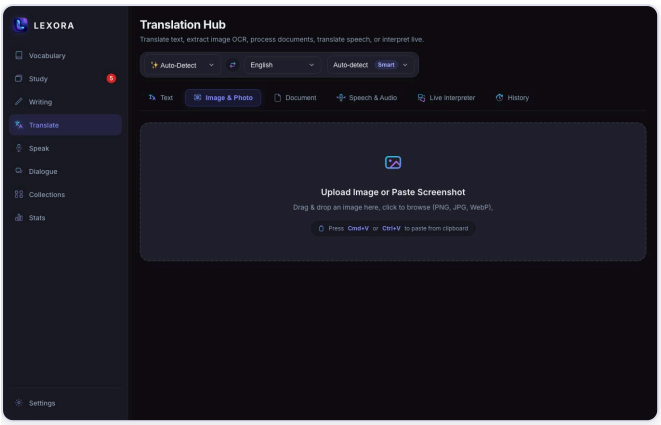

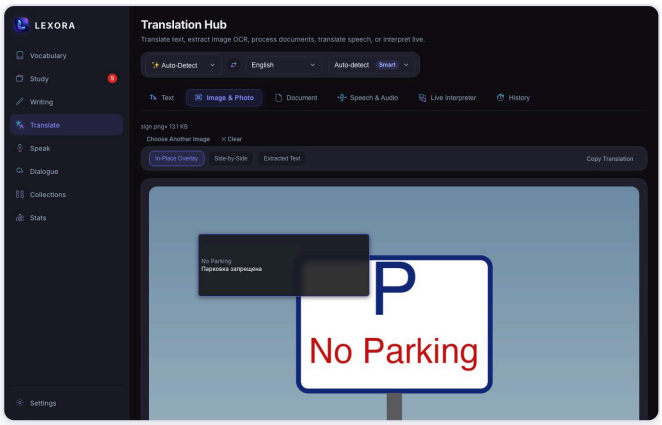

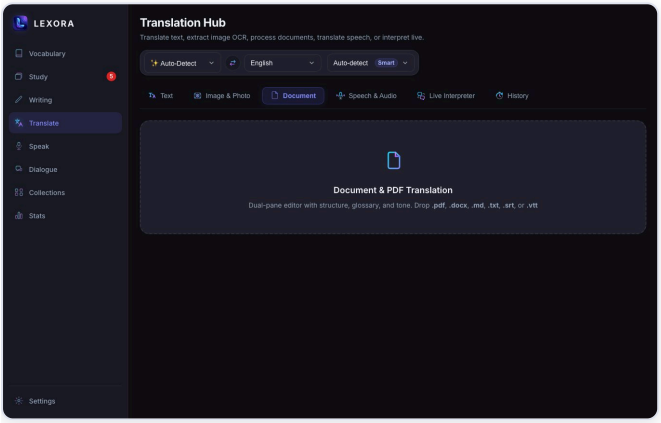

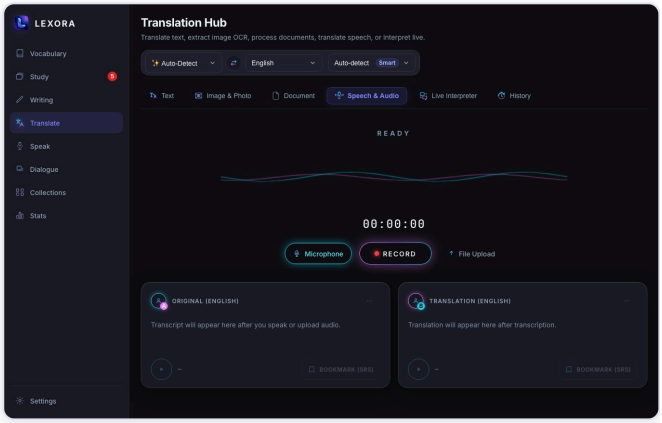

Image & Photo: upload area.

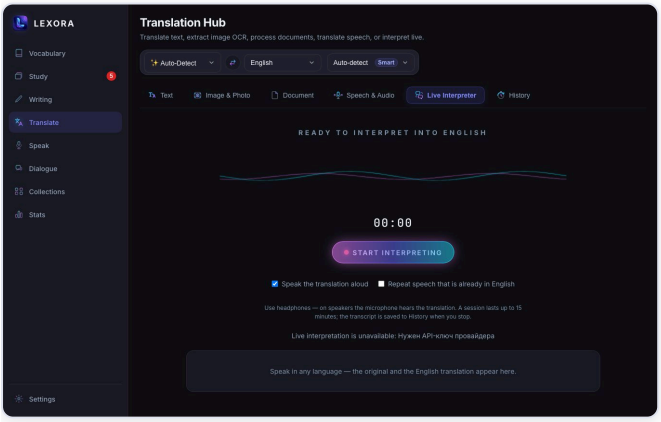

Result: translated text over the image ("No Parking" → "Парковка запрещена").

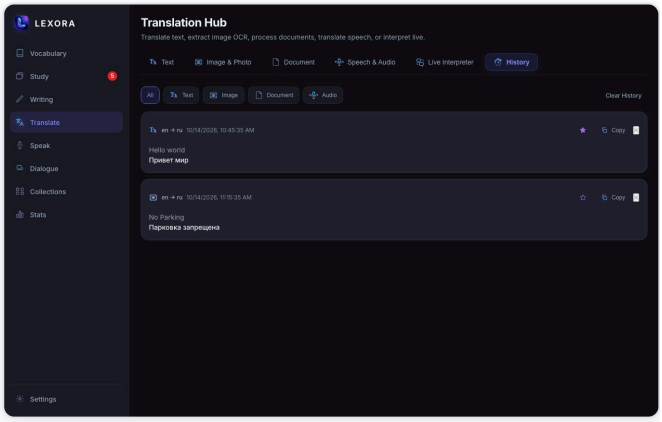

Document & PDF Translation.

Speech & Audio: Microphone / Record / File Upload; below — original and translation.

Live Interpreter. If the AI role is not configured, the reason is shown at the bottom ("API key needed").

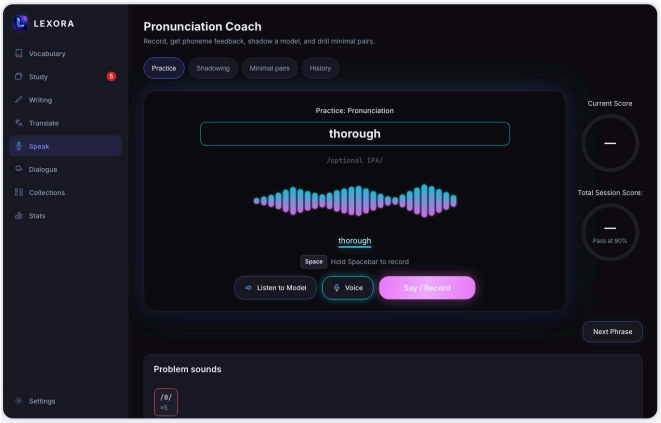

History.

9. Speak — pronunciation coach

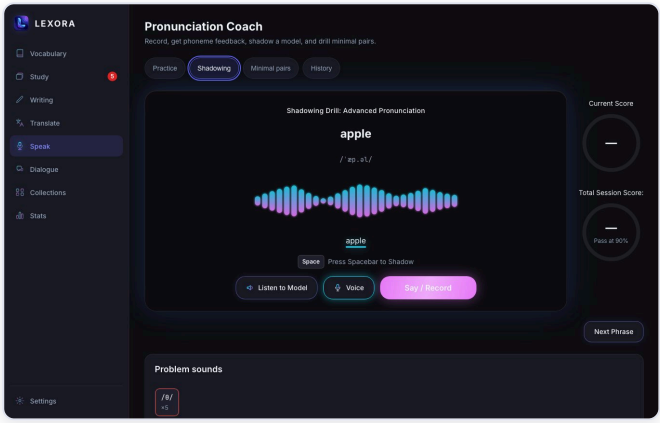

Four tabs: **Practice**, **Shadowing**, **Minimal pairs**, **History**. Results are scored 0–100 and per phoneme; the pass mark is 90%.

Practice

Enter a word or phrase (you can set a target IPA transcription). **Listen to Model** plays the reference pronunciation, **Voice** selects the voice, **Say / Record** records (or hold `Space`). After recording you see "Current Score" and the session total "Total Session Score". Click a problem phoneme to get an articulation tip (e.g. "Close both lips…"). **Next Phrase** moves on.

Practice: reference waveform, Listen to Model / Voice / Say-Record buttons, score rings and the "Problem sounds" block.

Shadowing Drill.

Shadowing

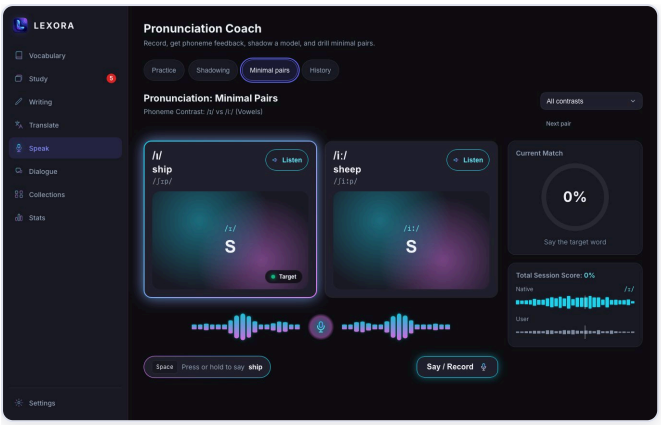

The phrase comes from your review queue. Listen to the sample and repeat right after it (*Say phrase* → "Speak now" → *Stop recording*); speech waveforms are compared and the result is "Passed" or not.

Minimal pairs

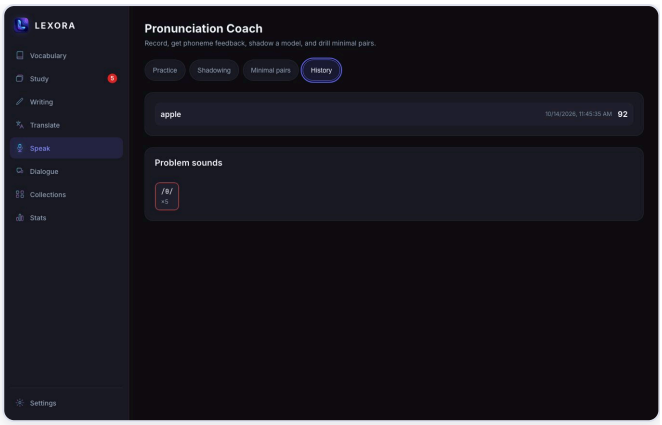

Word pairs that differ by one sound (ship / sheep, /ɪ/ vs /iː/). Listen to both (*Listen*), then say the target word — you get a match score. The contrast can be chosen in the list at the top right.

History

A list of past attempts with scores; the "Problem sounds" block (your most problematic sounds) is built from them and is also visible in Stats.

Minimal Pairs.

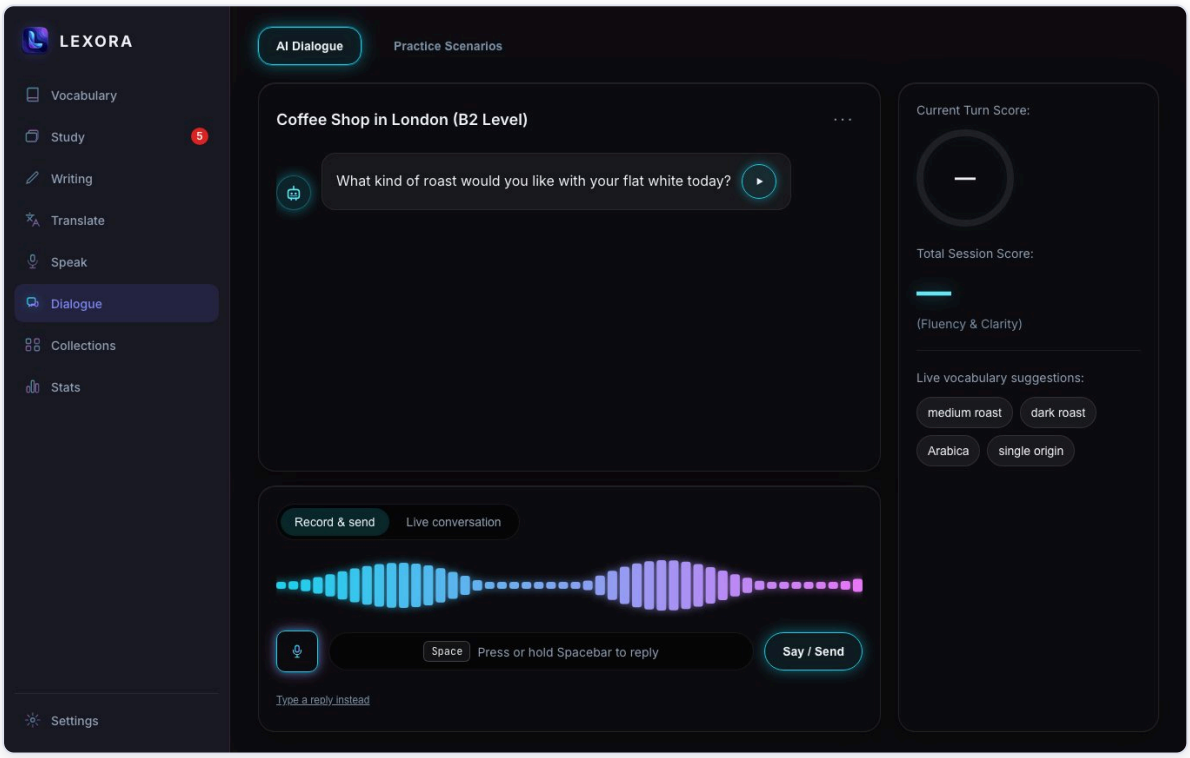

Attempt history.

10. Dialogue — AI conversation

At the top left are the **AI Dialogue** and **Practice Scenarios** tabs. Choose a scenario with a level (e.g. "Coffee Shop in London (B2 Level)"). The AI partner opens the conversation with a first line and plays a role (barista, shop assistant, etc.).

- **Record & send** — record a reply by voice: hold `Space`, release and the reply is sent (*Say / Send*).
- **Live conversation** — live voice dialogue mode (needs a provider with realtime voice — Gemini Live).
- **Type a reply instead** — answer in text.
- On the right — **Current Turn Score** (score of the reply), **Total Session Score** (Fluency & Clarity) and **Live vocabulary suggestions** — useful expressions for the scenario.

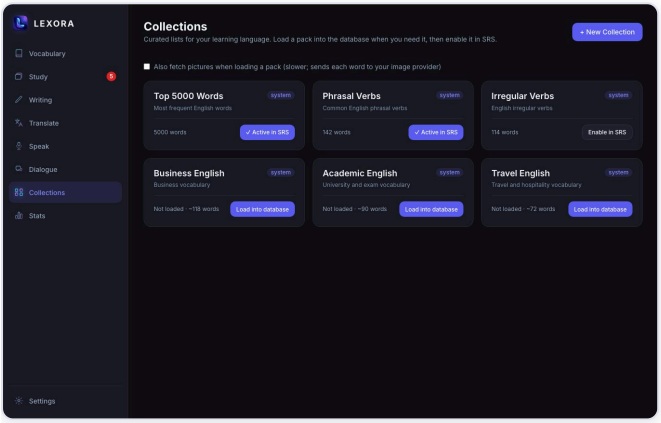

Dialogue: the AI line, recording panel and score counters.

11. Collections — word packs

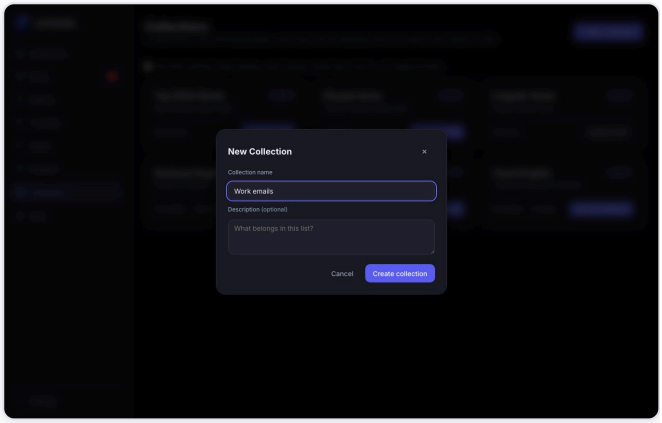

Ready-made ("system") packs for the learning language: **Top 5000 Words**, **Phrasal Verbs**, **Irregular Verbs**, **Business English**, **Academic English**, **Travel English**. A pack must first be loaded into the database, then enabled in SRS:

1. **Load into database** — loads the pack's words (about 5000 for Top 5000). The checkbox "Also fetch pictures when loading a pack" additionally fetches pictures (slower; uses the image provider).
2. **Enable in SRS** / "Active in SRS" — enable or disable the pack in reviews.

+ New Collection creates your own collection (name and description).

Collections: loaded packs show "Active in SRS" / "Enable in SRS", others show "Load into database".

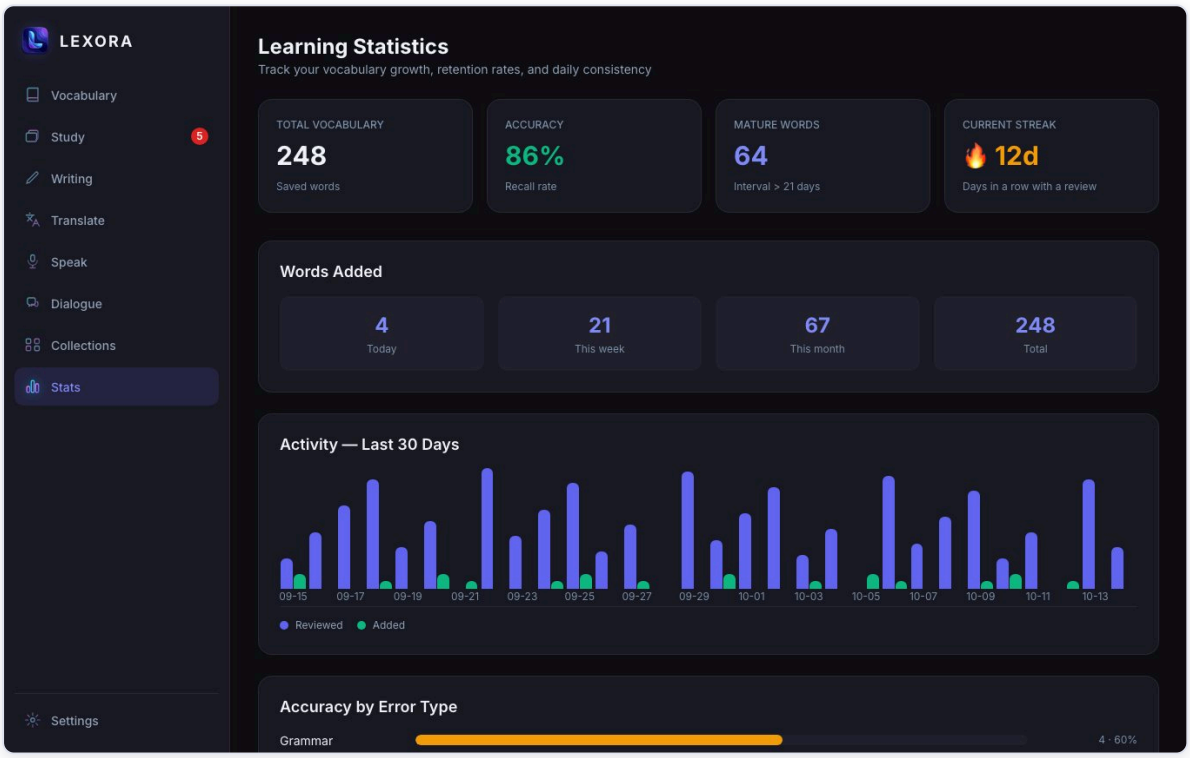

Creating a collection.

Packs can also be used as a source for desktop stickers (Settings → Stickers).

12. Stats — statistics

- **Total Vocabulary** — all words; **Accuracy** — percentage of correct answers; **Mature Words** — words with an interval > 21 days; **Current Streak** — consecutive days with a review.
- **Words Added** — added today / this week / this month / total.
- **Activity — Last 30 Days** — chart: reviews (blue) and added words (green) per day.
- **Accuracy by Error Type** — accuracy by error type (grammar, spelling…).
- **Hardest Words** — words with the most mistakes and low accuracy.
- **SRS Mastery Stages** — New / Learning / Review / Mature.
- **Writing Mistake Patterns** and **Pronunciation** — typical writing mistakes and problem sounds.

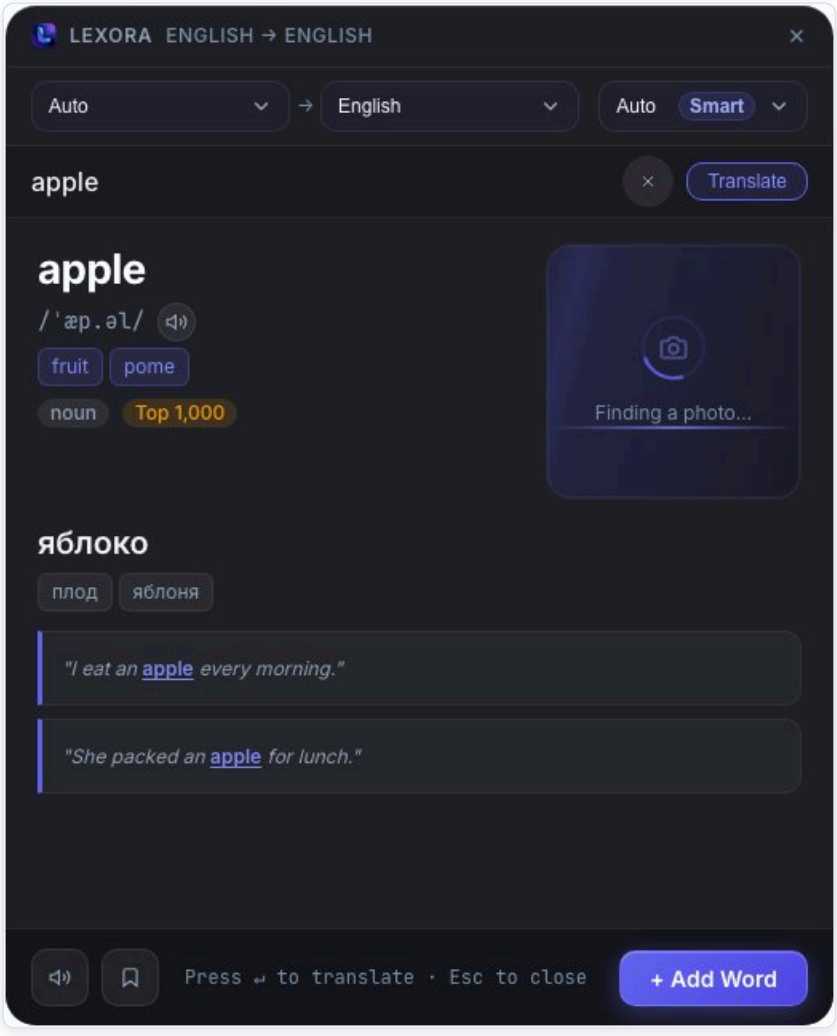

Learning Statistics.

13. Outside the main window

Popup translator

Select text in any app (browser, PDF, notes) and press `⌘⇧L` (Windows: `Ctrl+Shift+L`). A popup opens with the translation, transcription, synonyms, frequency, picture and examples. Text is taken only from the selection, never from the clipboard. The window closes with `Esc`.

- **+ Add Word** — save the word to your vocabulary (the button becomes "✓ Added to Vocabulary").
- 🔊 — playback, bookmark — save to history, **Translate**/`Enter` — translate manually entered text.
- Source/target language and mode ("Auto" / "Smart") can be chosen right in the window.
- For longer selected text the window works as a built-in AI assistant: you can accept and replace the text in the app (*accept and replace*).

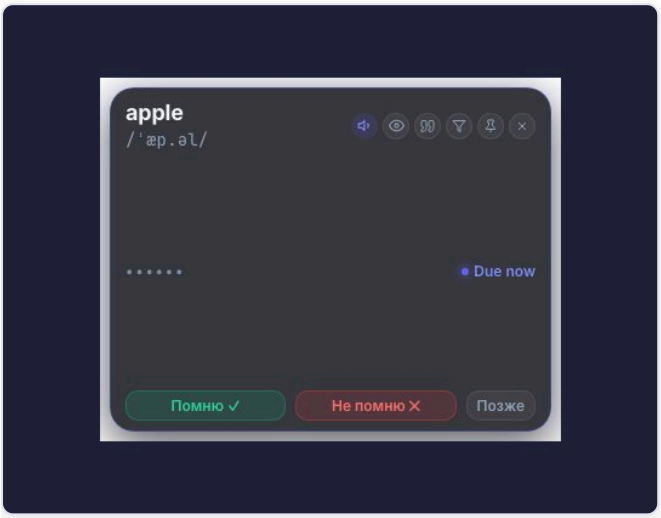

Popup translator: "apple" → "яблоко", alternatives, examples and "+ Add Word".

Desktop stickers

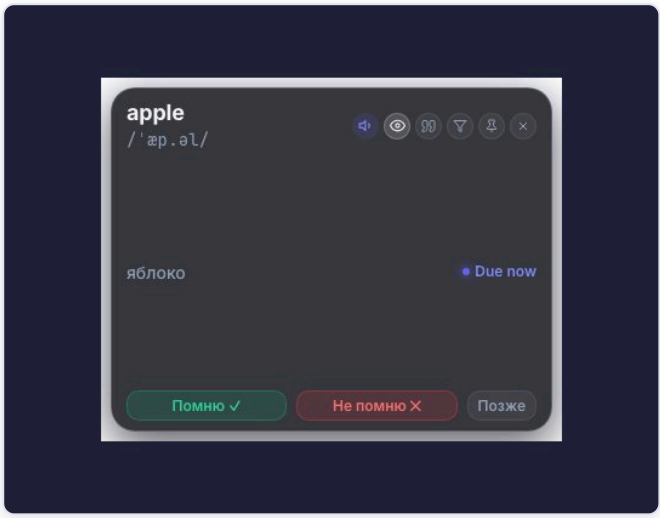

Small translucent cards over your desktop for ambient review. A card shows the word and transcription; the translation is hidden (the eye button reveals it). Rate yourself:

- **Помню ✓** (I remember) — the word is retained; **Не помню ✕** (I don't remember) — it comes back sooner; **Позже** (Later) — postpone. After you answer, the card disappears and is replaced by the next one.
- Top buttons: playback, show translation, example quote, word-source filter, pin on top, close.

Show/hide all stickers: `⌘⇧S` or "Toggle Stickers" in the tray menu. Count, opacity, word sources and quiet hours — Settings → Stickers.

Sticker with the translation hidden.

Sticker with the translation shown.

Tray menu

The Lexora icon in the menu bar (macOS) / system tray: **Open Lexora**, **Open Translator** (an empty translator window; nothing is taken from the clipboard), **Translate Selection**, **Toggle Stickers**, **Quit**. On macOS, translating selected text is also available via right-click → Services → Lexora.

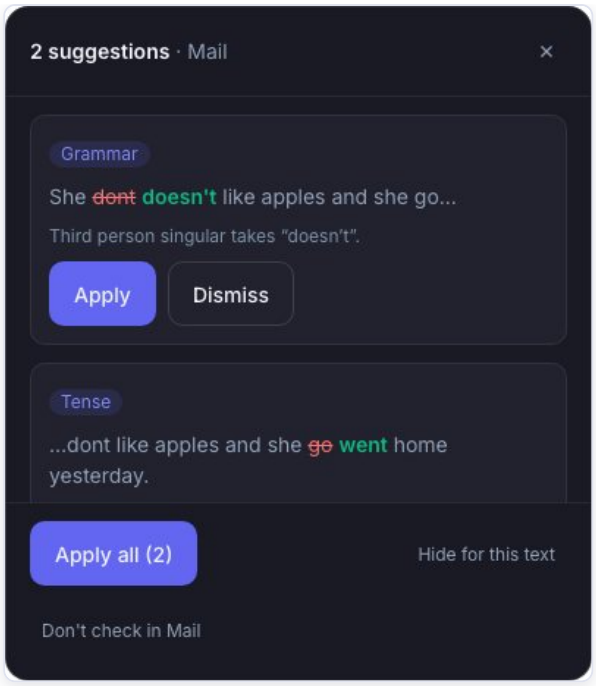

Writing check in other apps ("like Grammarly")

Enabled in Settings → "Writing check in other apps" (off by default; macOS and Windows; requires the same Accessibility permission).

- Lexora watches the text field you are typing in. After a ~0.7 s pause the text is sent to the AI provider for a check in the learning language.
- A **badge** with the number of suggestions appears at the corner of the field.
- Clicking the badge opens a panel with fix cards; **Apply** changes the text right in the field (first just the fragment via Accessibility — formatting and undo are preserved; if the app refuses writes, via the clipboard). If you changed the text after the check, the fix is not applied. **Dismiss** rejects a suggestion, `Esc` closes the panel.
- Not read: password fields, search fields, apps on the exclusion list (password managers, terminals, IDEs — editable in settings), text not in the learning language. Checks are not saved to the database.

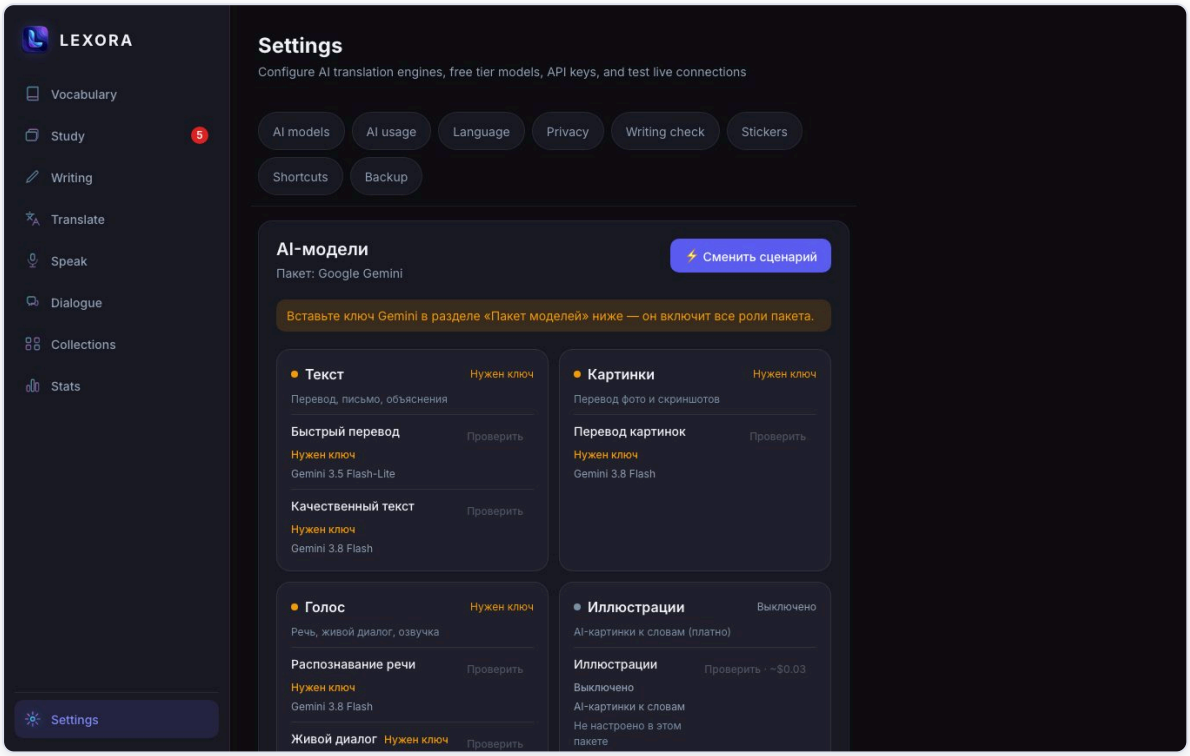

Badge with the suggestion count

Fix panel in the Mail app

14. Configuring the app (Settings)

The settings page is one long screen with a quick-jump bar at the top: *AI models* · *AI usage* · *Language* · *Privacy* · *Writing check* · *Stickers* · *Shortcuts* · *Backup*. Changes in most sections are applied after pressing **Save Settings** at the bottom ("Settings saved successfully").

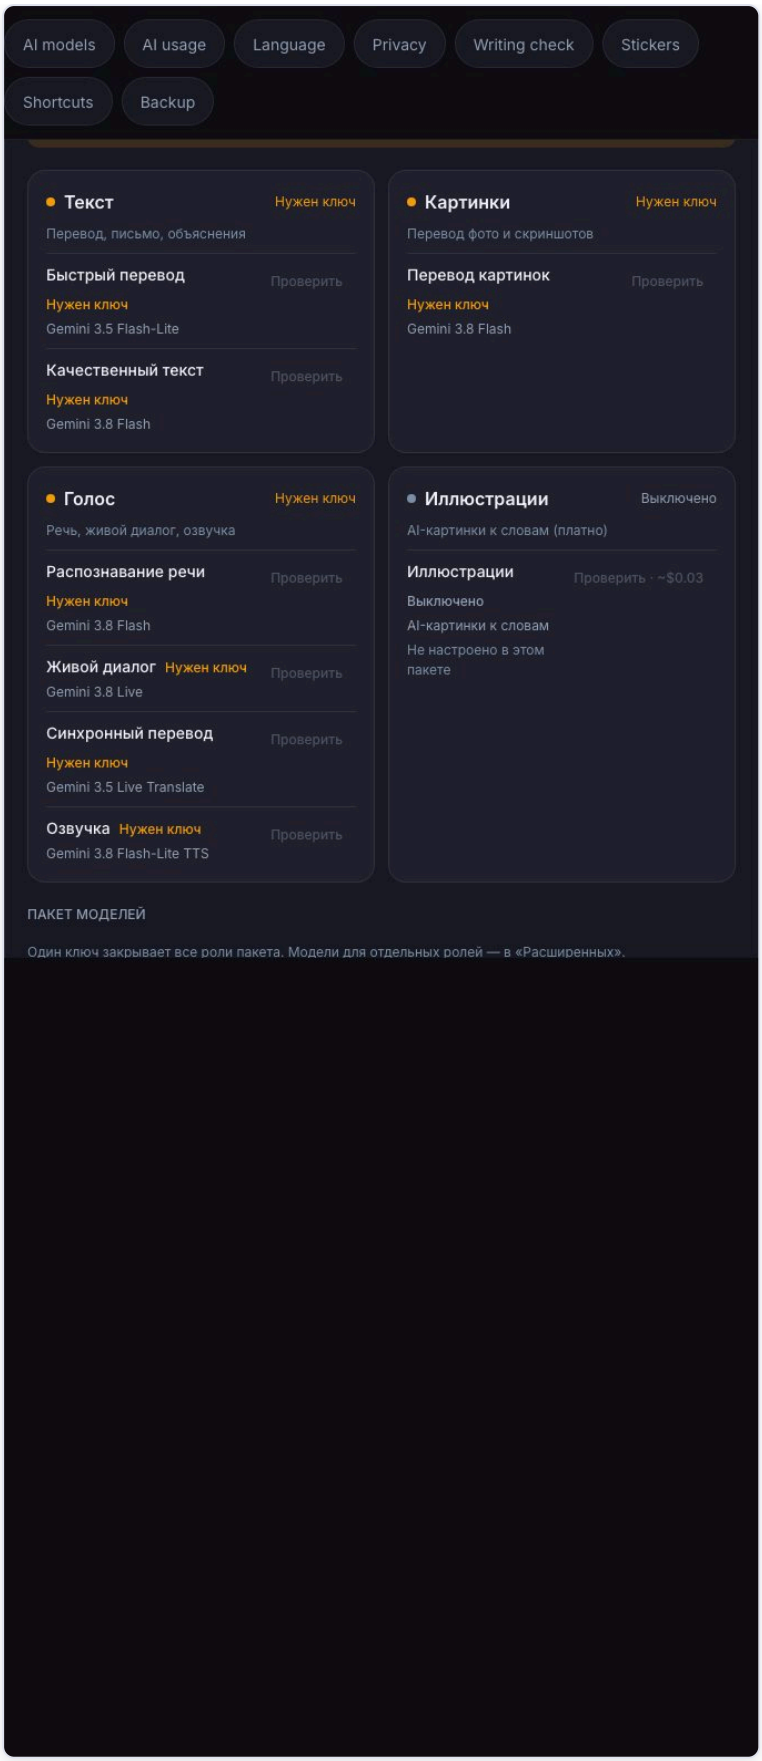

Top of Settings: jump bar and the "AI-модели" (AI models) section. Note: this part of the UI is in Russian.

14.1. AI models

Lexora splits AI work into **roles**, and a model is chosen for each. Roles are grouped:

Group	Roles
Text	Fast translation; Quality text (writing, explanations).
Images	Image translation (vision).
Voice	Speech recognition; Live dialogue; Live interpreting; Text-to-speech.
Illustrations	AI pictures for words (paid, ≈ $0.03 per picture; off by default — free photos are used instead).

The state of each role is shown by a label: "Работает" (Working), "Нужен ключ" (Key needed), "Выключено" (Off), "Не настроено в этом пакете" (Not set up in this package). The **Проверить** (Check) button sends a test request.

"AI models" section: roles by group, model packages and the API key field.

Model packages

A package is a ready-made set of routes for all roles: one key covers everything.

Package	What it gives
Google Gemini (recommended)	Free tier. One key for everything: translation, photos, voice, live dialogue and live interpreting.
OpenAI	Pay per use. Strong text, recognition, neural voice. Live voice is currently Gemini-only.
Cloudflare	Free. Free text (Llama) and FLUX pictures. No photo or speech recognition.
Local (Ollama)	Models on your computer: text and photo without the cloud. Voice is the system one.
No AI	Built-in dictionary, free photos and system voice. No keys.

API keys

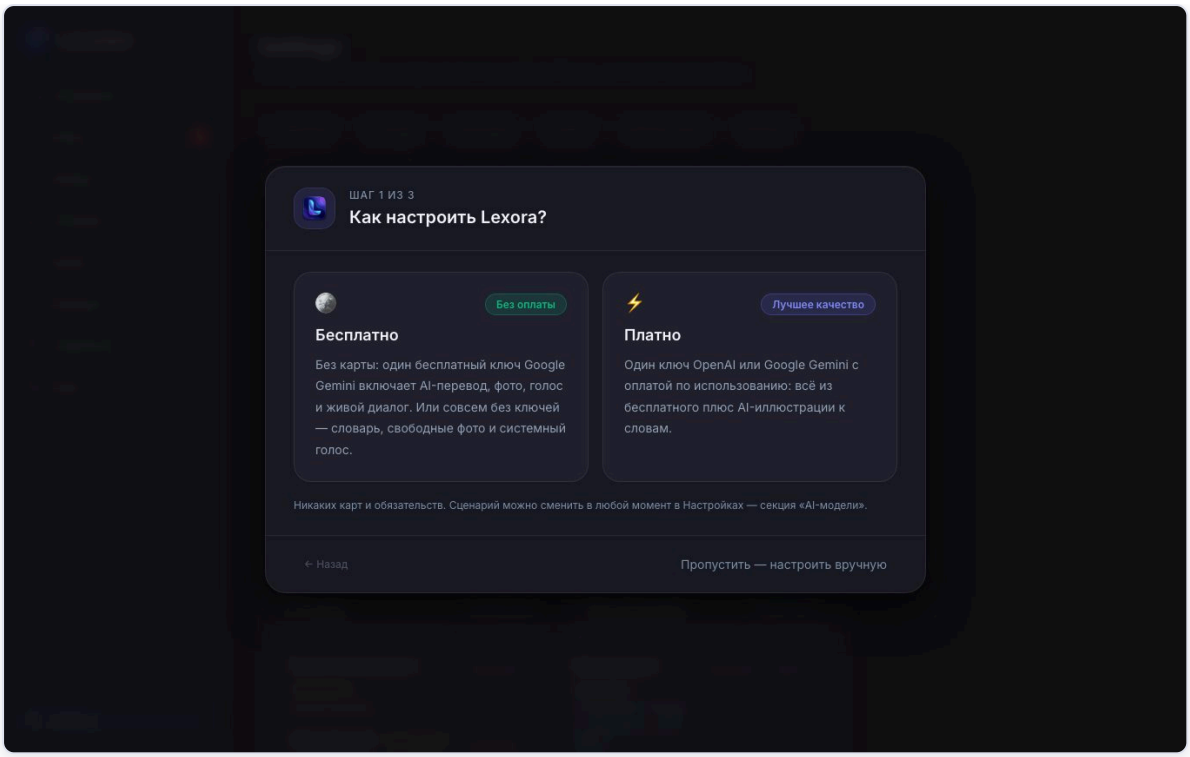

Paste the key in the package's "API key" field and press **Сохранить** (Save). Keys are stored via `tauri-plugin-store`, not in plain-text files. Alternatively use environment variables:

Provider	Environment variables	Audio
OpenAI	`OPENAI_API_KEY`	yes (Whisper)
Google Gemini	`GEMINI_API_KEY`	yes (native)
Anthropic Claude	`ANTHROPIC_API_KEY`	no (text only)
Cloudflare Workers AI	`CLOUDFLARE_API_KEY`, `CLOUDFLARE_ACCOUNT_ID`	no
OpenRouter	`OPENROUTER_API_KEY`	model-dependent
Groq	`GROQ_API_KEY`	model-dependent
Custom / Ollama	`CUSTOM_API_KEY` (not needed for local models)	model-dependent

> **Local models.** For Ollama / LM Studio choose the `custom` provider and set an OpenAI-compatible base URL, e.g. `http://localhost:11434/v1`.

Advanced: a model for each role

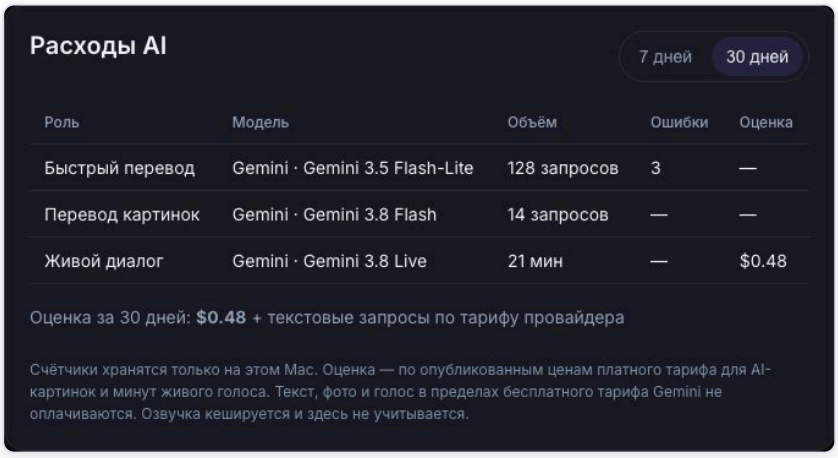

The collapsible block "Расширенные: модель для каждой роли" (Advanced: model per role) lets you set a model for each role and a chain of fallbacks: if the primary is unavailable or rate-limited, Lexora switches to the next one.

"Сменить сценарий" (Change scenario) reopens the setup wizard.

14.2. AI usage

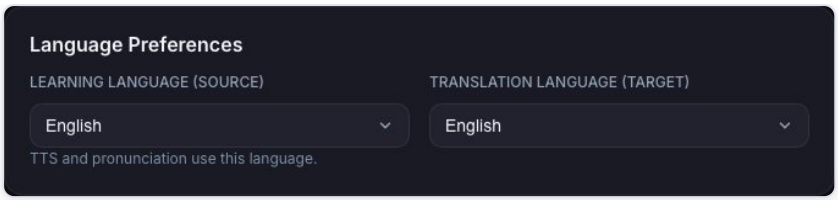

A table for 7 or 30 days: role, model, volume (requests or live-voice minutes), errors and a cost estimate. Counters are stored only on this computer. The estimate uses published prices of paid features (AI pictures, live-voice minutes); text, photo and voice within the Gemini free tier are not billed. Speech playback is cached and not counted.

AI usage.

14.3. Language Preferences

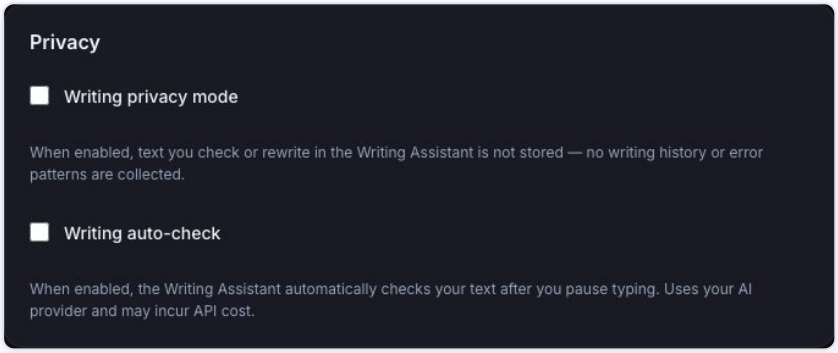

- **Learning language (source)** — the language you study. TTS, pronunciation, writing check and word packs use it.
- **Translation language (target)** — the language words are translated into (your native one).

Language settings.

14.4. Privacy

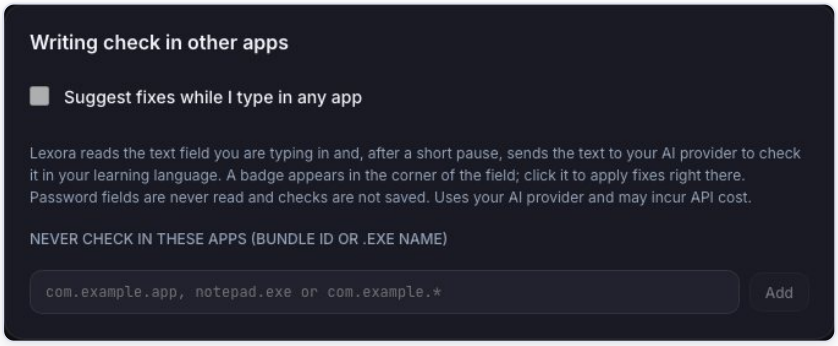

- **Writing privacy mode** — texts from the Writing Assistant are not stored; no history or error patterns are collected.
- **Writing auto-check** — auto-check after you pause typing (uses AI and may cost money).

Privacy.

14.5. Writing check in other apps

- The **Suggest fixes while I type in any app** toggle enables background checking (see section 13). On first enable, grant the Accessibility permission.
- **Never check in these apps** — an exclusion list (bundle ID on macOS or the `.exe` name on Windows); *Add* adds an app. An app can also be excluded in one click from the fix panel.

Writing check in other apps.

14.6. Desktop Stickers & Ambient Review

Setting	Description
Max concurrent stickers	How many stickers are shown at once.
Sticker opacity	Opacity (90% by default).
Words on stickers	Word sources: "All vocabulary", "My words" and/or individual collections (Top 5000, Phrasal Verbs, Irregular Verbs, Business, Academic, Travel) — several can be selected.
Quiet hours	During the set interval (e.g. 21:00–08:00) stickers are hidden.

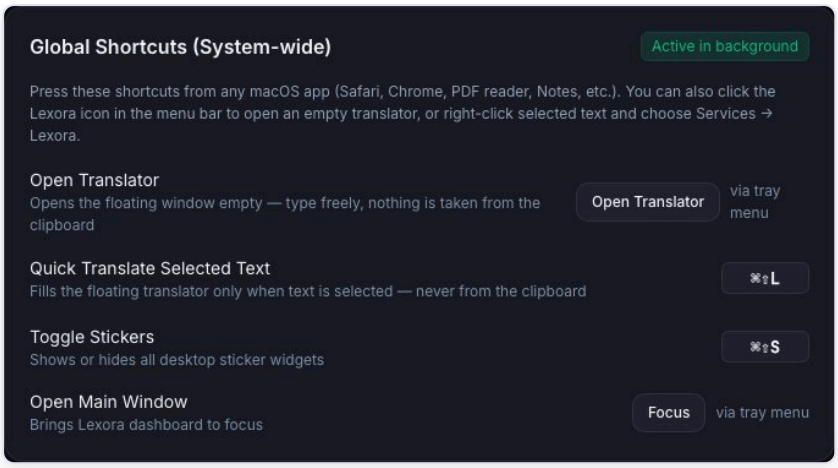

Sticker settings.

14.7. Global Shortcuts

They work system-wide, even when the Lexora window is hidden. To change a shortcut, click the field and press the desired combination; duplicates and invalid combinations are flagged. Remember to press **Save Settings**.

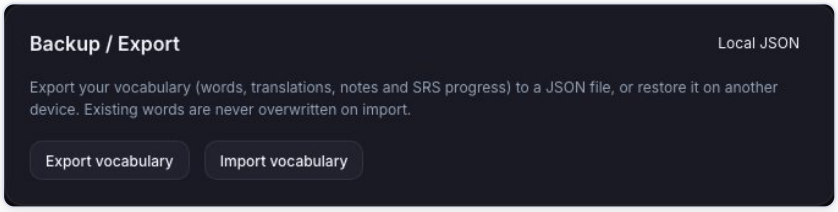

Action	macOS (default)	Windows/Linux
Quick Translate Selected Text	`⌘⇧L`	`Ctrl+Shift+L`
Toggle Stickers	`⌘⇧S`	`Ctrl+Shift+S`
Open Translator (empty window)	button in settings / tray item	
Open Main Window	tray item "Open Lexora"	

Global Shortcuts.

14.8. Backup / Export

Export vocabulary saves your vocabulary (words, translations, notes and SRS progress) to a JSON file. **Import vocabulary** restores it on another computer; existing words are not overwritten on import.

Backup / Export.

15. Data, backups and privacy

- **Where data is stored.** In the SQLite file `lexora.db` in the app data directory (WAL mode). All writes are transactional.
- **Integrity check.** On every launch. If the database is corrupt, the file is not deleted but renamed to `lexora.db.corrupt-<time>`, and the app recovers from the most recent automatic copy.
- **Automatic copies.** Stored in the `backups/` subfolder of the data directory (`lexora-backup-…`); several recent ones are kept and older ones are deleted automatically.
- **Manual export.** Settings → Backup → Export vocabulary (JSON).
- **Caches.** Word pictures and speech audio are cached locally and not requested again.
- **What goes over the network.** Only requests to the AI provider you chose (text for translation/checking, audio for recognition, pictures) and requests for free photos. No analytics or telemetry. In "No AI" mode the network is not used.
- **API keys.** Stored via `tauri-plugin-store` (not in plain text), or taken from environment variables.
- **Window security.** A CSP without `unsafe-eval` is configured, external HTML is sanitized with DOMPurify, and SQL uses parameterized queries only.

16. Keyboard shortcuts

Keys	Where	Action
`⌘⇧L` / `Ctrl+Shift+L`	Everywhere	Translate selected text (popup)
`⌘⇧S` / `Ctrl+Shift+S`	Everywhere	Show/hide stickers
`Space`	Flashcards	Show answer
`Enter`	Input modes, popup	Check answer / translate
`Space` (hold)	Speak, Dialogue	Record voice
`⌘V`	Translate → Image	Paste a screenshot from the clipboard
`Esc`	Popup, dialogs, fix panel	Close

17. Troubleshooting

Problem	What to do
macOS won't open the app ("unidentified developer")	Run `Разрешить Lexora.command` from the DMG, or System Settings → Privacy & Security → "Open Anyway".
The hotkey opens the popup but the selected text is not filled in	Grant Lexora the Accessibility permission and restart the app.
AI models show "Нужен ключ" (Key needed)	Paste the package key and press Save, then "Check" on the role. Free Gemini key: aistudio.google.com → Get API key.
Live Interpreter / live dialogue does not work	These roles are available only with providers that offer realtime voice (currently Gemini). With OpenAI/Cloudflare/Ollama use recorded speech or text.
Photo or speech translation unavailable	Anthropic and Cloudflare do not support audio/vision in this configuration — choose the Gemini or OpenAI package.
Stickers do not appear	Check "Quiet hours", the sticker count and word source (there must be words due); toggle with `⌘⇧S`.
The badge for the writing check in other apps does not appear	Enable the feature in Settings and grant Accessibility; the field must not be a password/search field and the app must not be excluded; the text language must match the learning language.
"I want to work offline"	Choose the "No AI" package: vocabulary, reviews, statistics and system speech work offline.
The database is corrupt	Lexora recovers from an automatic copy on its own. The corrupt file is kept as `lexora.db.corrupt-…`. You can also import a previously exported JSON.
